Cleveland Cord Blood Center researchers explore the use of cord blood-derived cells for diseases ranging from Parkinson's disease and wound healing to Type 1 diabetes and HIV/AIDS.

The Cleveland Cord Blood Center collects, processes, stores and distributes stem-cell rich umbilical cord blood.

Cord blood units from CCBC are used by our researchers as well as others around the country to explore and advance umbilical cord blood's untapped potential as a life-saving cell therapy treatment.

The Cleveland Cord Blood Center is saving lives, enhancing health and expanding knowledge one birth at a time.

The Cleveland Cord Blood Center has five collection sites in three markets - Cleveland, Atlanta and San Francisco. Since 2008, CCBC has distributed cord blood units that have reached 32 states and 21 countries.
